

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

1. (original): A fluid dispenser comprising:  
a fluid reservoir (10) serving to contain fluid;

and

a dispenser head (2) mounted on the reservoir (10) to take fluid from the reservoir, said head (2) defining a dispensing chamber (26) communicating with the reservoir via an inlet valve (25, 215) and communicating with the outside at a dispensing orifice via an outlet valve (237, 222);

said dispenser being characterized in that the chamber (26) comprises at least one elastically deformable actuating wall (231) that is depressed in order to generate a pressure inside the chamber that is high enough to close the inlet valve and to open the outlet valve.

2. (original): A dispenser according to claim 1, in which the actuating wall (231) is formed by a sleeve (23) that is at least locally flexible and that internally defines a portion (263) of the dispensing chamber (26).

3. (currently amended): A dispenser according to claim 1 ~~or claim 2~~, in which the head (2) has a top (222) opposite from the reservoir, the dispensing orifice (27) being placed substantially at the top of the head.

4. (currently amended): A dispenser according to claim 1, ~~claim 2, or claim 3~~, in which the outlet valve forms the dispensing orifice from which the dispensed fluid can be collected.

5. (currently amended): A dispenser according to claim 2, ~~claim 3, or claim 4~~, in which the sleeve (23) has a stationary end forming anchor means (234) and an opposite end forming a flexible lip (237) in leaktight abutment against a seat (222), the lip and the seat together forming the outlet valve.

6. (currently amended): A dispenser according to claim 1 ~~any preceding claim~~, in which the head (2) has a body (21) forming a ring (211) serving to co-operate with the reservoir (10) for fastening the head (2) to the reservoir (1), said body (21) forming an inlet valve seat (215).

7. (currently amended): A dispenser according to claim 1 ~~any preceding claim~~, in which the head (2) further has a tube (22) having a fastening end (277) and an opposite end (222) forming an outlet valve seat, the sleeve (23) extending around the tube (22).

8. (original): A dispenser according to claim 7, in which the tube (22) defines an internal volume (262) in which the inlet valve (25, 215) is received, the internal volume communicating with a peripheral volume (263) that extends around the tube inside the sleeve (23) via at least one through opening (233), the dispensing chamber (26) including the internal volume (262) and the external volume (263).

9. (currently amended): A dispenser according to claim 1~~any one of claims 5, 6, and 7~~, in which the tube (22) is fastened to the body (21) via its fastening end (227), the sleeve (23) being fastened to the tube and to the body via its anchor means (234).

10. (currently amended): A dispenser according to claim 1~~any preceding claim~~, in which the reservoir is "airless", i.e. it does not have any air intake.

11. (currently amended): A dispenser according to claim 1~~any preceding claim~~, in which the reservoir (10) is elongate and is preferably in the form of a fine tube.

12. (currently amended): A dispenser according to claim 1~~any preceding claim~~, having the general shape of a pen that can be grasped in the hand in the manner of a pen, so that at least one finger of the hand is placed on the actuating wall (231) with the dispensing orifice disposed at the tip of the pen.

13. (currently amended): A dispenser according to claim 2~~any one of claims 2 to 12~~, in which the sleeve (23) is surrounded by a substantially rigid sheath (24') that defines at least one window (245) giving access to the actuating wall (231).

14. (currently amended): A dispenser according to claim 2~~any one of claims 2 to 13~~, in which the sleeve (23) is provided with a cap (25; 28) preventing access to the actuating wall.

15. (currently amended): A dispenser according to claim 13 ~~and 14~~, in which the cap (25) is mounted to turn on the rigid sheath (24') and is provided with at least one opening (255) serving to come into register with said at least one window (245) in a manner such as to enable the actuating wall to be accessed through a window and through an opening, with the window and the opening being mutually in register.

16. (original): A dispenser according to claim 14, in which the cap (28) has a collar (284) in contact with the sleeve.
